How To Use The Tinnerman® Parts Catalog

This Tinnerman fastener catalog is designed to help solve your fastening problems quickly and efficiently. The “383” includes seven separate sections, each covering a category of Tinnerman fasteners for specific applications or assembly advantages. The catalog identifies each category with product illustrations and serves as an index for easy location and quick reference.

Once the category and type of fastener required have been determined, isolating the exact design is a simple matter of deduction. The basic or standard designs are shown in the dimensional drawings on each charted page. Major envelope dimensions are shown as variable call-out letters which appear in the column heads of the chart. The charts are organized as follows:

1	2	3	4	5
Column one, and usually column two, give the screw size, stud size, tube dia., panel range, etc., which are prime factors for selection and application.	Design Variations column indicates whether a part is standard (as drawn and specified “Std”) or a modification of standard e.g., A, B, C, or ABC in combination. Such variations are identified and illustrated. Parts are available only as specified in the Design Variation column. Further modification requires special tooling and order processing.	The remaining columns chart the envelope dimensions such as length A, width B, edge of panel to mounting hole C, material thickness T. These call-out letters have been standardized to always represent the same dimension (e.g., A is always length). This makes it easier to discuss dimensions without confusion.	The last column, or extreme right hand, is the part number column. The full part number as shown should always be used. The dash numbers specify screw size, stud size, material thickness and are critical for proper identification.	Preferred finish is indicated by a second dash number. See pages 6 and 7 of this section for standard finish descriptions and proper call out.

Tinnerman® Fastener Samples

To assure you of proper fastener selection and for production line testing, we offer a complete sample service. Transparent zip-lock envelopes permit quick visual identity for easy reference. Large quantities for extensive production testing can be supplied on special request.

Your Eaton Representative...

...whether a direct Eaton field representative or an Authorized Distributor fastening specialist, your representative is a carefully trained, highly qualified fastening expert who is ready to help you make the most of Eaton’s Engineered Fastening service – and follow through to assure excellence in fastener selection and performance.

Tinnerman® Fastener Engineering Data

The Tinnerman® Principle of Spring Tension Fastening.

The greater the material thickness, the stronger the Tinnerman® fastener.

Tinnerman® fasteners are one-piece and self-locking. They provide an inward thread lock plus an arched spring lock which are energized as the screw tightens. The combined forces of this double-locking action resist vibration loosening...and are exclusive with Tinnerman spring steel fasteners.

While they provide a strong and reliable double-locking action with standard screws, even greater strength can be attained by increasing the material thickness of the fastener and using A- or B-type screws. The example illustrated nearly doubles tensile strength with only a 48% increase in material thickness.

Excessive small parts' handling can be drastically reduced through the use of the Tinnerman principle of spring tension fastening. Fully documented case histories prove that assembly savings of 30 to 80% have resulted from the following **inherent benefits**:

- easier handling, faster application
- elimination of lockwashers, spanner washers, and other loose pieces
- perform multiple functions
- self-retaining, self-locking
- no special tools, skills or equipment required
- will not "freeze" to threads or clog with paint
- ideal for service locations, reused indefinitely
- lock on unthreaded studs
- many types used without screw, stud or mounting hole.

Recommended Values For Peak Fastener Performance

Screw Size	Thrds. Per Inch	Max. Dia.	Root Dia.	Standard Max. Thick.	Clearance Hole Dia.	Installation Torque	Tensile Load Limit

Average Torque And Tensile Values

Tinnerman fasteners are tightened only enough to produce the **inward thread lock** and **arched spring lock** described above. They derive their locking characteristics, holding power and vibration resistance solely from spring tension. Unlike ordinary threaded nuts, they do not have to be tightened with a great amount of torque. In fact, any torque applied beyond the recommended installation torques charted above is excessive and could result in loss of spring tension resiliency.

The table shows the **average** amount of torque to use in tightening Tinnerman fasteners, plus the **average** tensile load limits. These averages

were determined through exhaustive testing. It is recommended that these values be followed. Averages were established as guides for general application. Consult your Eaton representative for torque and tensile data on special or specific parts.

Tests prove that Tinnerman fasteners will withstand greater tensile loads if the screw holes provide **minimum** clearance. We recommend the above screw clearance hole diameters. These do not apply to self-retaining fasteners, e.g. "U" or "J" types, where part of the fastener engages the mounting, or clearance hole.

Screw Lengths

The proper lengths of machine screws to use with Tinnerman fasteners are the same as for general practice, i.e., 1-1/2 thread protrusion beyond the threads (or prongs) of the fastener.

Since A- or B-type sheet metal screws taper at the end, longer screws must be used. Sheet metal screws **must** protrude 2 to 3 threads beyond the prongs to assure proper grip on the full root diameter of the screw.

Important—All Tinnerman fasteners shown in this catalog are of the Standard-Thread Fit Class unless otherwise specified!

Standard Fit: Tinnerman fasteners have a free-running fit on the screw threads for maximum speed in assembly. When the screw is tightened, the arch in the base diminishes, forcing the prongs inward and upward at the root of the threads and creating a high-resistance back-off torque.

Zip-on Fit: Tinnerman fasteners made with longer, more resilient prongs permit zipping the fastener over screw threads. Only one or two turns of the screw are necessary to tighten. Excellent for rapid assembly. Not recommended where heavy torque/tensile loads are applied.

Prevailing Torque Fit: Tinnerman fasteners are made to provide a restraining torque at any location on the screw threads. This fit is recommended when the fastener is used as an adjustment nut.

Standard Finishes For Tinnerman® Fasteners

Listed below are the most commonly used finishes available for protective coating and rust-proofing Tinnerman® Engineered Fasteners.

To specify desired finish, use corresponding dash number, shown below as the last dash number, affixed to the part number.

Examples: C183-012-**27**, C1053-012-**4**, C1158-5610-**1**

Finish	Description	Color	Advantages	Salt Spray Test
-27 Soluble Oil Dipped	Ferrous parts (except stainless steel) have a light coating of soluble oil applied. Non-ferrous parts are cleaned where necessary and are left in plain condition.	Natural.	Low-cost finish, recommended on ferrous parts for conditions of relatively little corrosion or for parts that are to receive a finish in the customer's plants.	5% solution at 95° F. Ferrous parts: first rust spots after 1 hour, end point (1/16" dia. rust spots) after 2-1/2 hours. Non-ferrous parts: corrosion will be normal for the plain finish of the material.
-4 Phosphate and Oil	Parts are phosphate coated, then dipped in a special oil and spun dry.	Black.	Moderate corrosion resistance. Neat in appearance — will not wear off in handling.	5% solution at 95° F. First rust spots after 32 hours. End point (1/16" dia. rust spots) after 48 hours.
-1 Phosphate and 2 Coats Olive Drab Paint	Parts are phosphate coated, then two coats olive drab paint are applied. Each coat is properly baked to obtain maximum protection.	Olive drab.	Good corrosion resistance. Does not cause hydrogen embrittlement common with electroplated high carbon spring steel. Excellent for insulating dissimilar metals against electrolytic action.	5% solution at 95° F. First rust spots after 48 hours. End point (1/16" dia. rust spots) after 96 hours.
-67 Phosphate and 2 Coats Aluminum Paint	Parts are phosphate coated, then two coats of aluminum paint are applied. Each coat is properly baked to insure maximum protection.	Aluminum color—smooth appearance.	Recommended in place of cadmium plating where appearance and corrosion resistance are requirements. High in abrasion resistance and a non-conductor of electricity.	5% solution at 95° F. First rust spots after 48 hours. End point (1/16" dia. rust spots) after 96 hours.
-373 Phosphate, 2 Coats of Paint and Oil	Parts are phosphate coated, then two coats of a bright green paint are applied. Each coat is properly baked. A supplementary coat of a special oil solution is added to insure the maximum corrosion resistance possible.	Bright green.	Exceptional corrosion resistance. Insulates dissimilar metals against electrolytic action. Does not cause hydrogen embrittlement.	5% solution at 95° F. First rust spots after 150 hours. End point (1/16" dia. rust spots) after 250 hours.
-963 Water based zinc coating Dacromat 320 or equivalent plus clear sealer	Parts are coated in a water based zinc coating for maximum protection.	Grey metallic.	Exceptional corrosion resistance. Does not cause hydrogen embrittlement.	5% solution at 95° F. End point (1/16" dia. rust spots) after 400 hours.
-252 Water based zinc coating plus water base organic black coating	Parts are water based zinc coated with the second coat being an organic finish.	Black.	Exceptional corrosion resistance. Does not cause hydrogen embrittlement.	5% solution at 95° F. End point (1/16" dia. rust spots) after 400 hours.

NOTE: The following electroplate finishes are limited to only a few parts, such as Tubular Type Clips and Tube Clamps.

Please do not specify these finishes for other types of Tinnerman Fasteners without the approval of our engineering department.

-600 Zinc Mechanical- plate	Parts are mechanically plated from .00015" to .0003" thick. A clear chromate is applied as a sealer.	Satin Silver color.	Excellent electrical conductivity and moderate corrosion resistance. No hydrogen embrittlement.	5% solution at 95° F. End point (red rust) after 24 hours.
-3 B Zinc Electroplate	Parts are zinc electroplated from .00015" to .0002" thick and baked to reduce hydrogen embrittlement.	Silver color. Slight discoloration from baking may occur.	Excellent electrical conductivity and moderate corrosion resistance.	5% solution at 95° F. End point (red rust) after 24 hours.

Assembly Finishes For Cushioned Clamps

Listed below are the standard finishes available for protective coating and rustproofing Tinnerman® cushioned clamps.

To specify desired finish, use corresponding dash number, shown below as the last dash number, affixed to the assembly number.

Examples: C 3046-11-**89**, C 3046-11-**158**

Type of Assembly Finish	Finish Dash Number and Description		
Electroplated Plus Extruded Neoprene* Flame-Resistant Cushion	Cadmium	-90	.00015-.0002 cadmium
		-91	.0003 cadmium
	Zinc	-168	.00015-.0002 zinc
		-158	.0003 zinc
		-188	.0003 zinc plus dichromate dip
Electroplated Plus Dipped Neoprene** Flame-Resistant Cushion	Cadmium	-93	.00015-.0002 cadmium plus dichromate dip
		-94	.0003 cadmium plus dichromate dip
	Zinc	-167	.00015-.0002 zinc plus dichromate dip
		-161	.0003 zinc plus dichromate dip
Painted Plus Extruded Neoprene* Flame-Resistant Cushion		-89	phosphate and two coats of olive drab paint
		-179	phosphate and three coats of olive drab paint
		-30	phosphate and two coats of gray paint
Painted Plus Dipped Neoprene** Flame-Resistant Cushion		-16	phosphate and three coats of olive drab paint
Plain Plus Extruded Neoprene* Flame-Resistant Cushion		-92	plain finish degreased (for aluminum clamps only)
Plain Plus Dipped Neoprene** Flame-Resistant Cushion		-98	plain finish degreased (for aluminum clamps only)
Anodized Plus Extruded Neoprene* Flame-Resistant Cushion		-35	anodize (sulphuric plus dichromate seal)
Anodized Plus Dipped Neoprene** Flame-Resistant Cushion		-108	anodize (sulphuric plus dichromate seal)
*Also Available, EDPM extruded cushion **Also available, PVC Plastisol dipped cushions.	NOTE: -1 finish is the <i>standard</i> finish for "U" and "J" Type fasteners attached to Tinnerman Clamps, Retainer Rings and Strips and is applied <i>before</i> assembly. Other finishes can be applied where required, but such cases will be considered as <i>specials</i> with a new finish number assigned to the assembly.		

Materials Guide For Plastic Fasteners

Plastic materials for Tinnerman Fasteners are selected for their most appropriate characteristics, such as temperature factors, flame resistance, impact strength, etc. All fasteners are designed for top quality performance whether for general use or specific application.

Material	Part Number Suffix	Tinnerman Fastener Usage													
		Flame Class	Expansion Type	Toggles & Clinch Types	Wallboard Toggle	Cap Nut	Poly-Clamp	Dart Type	Clamps & Ratchet Strap	Adhesive Clamps	Sleeves	Slide Seal	TPI Inserts	Screws	Special
ABS	-AE	SB													■
Acetal	-AG	SB						■						■	
Nylon	-AA	SE	■	■			●	●	■		■			●	
Glass-Filled Nylon	-AC	SB													■
Polycarbonate	-AF	SE											■		
Polyethylene	-AB	SB				■	●					■			
Polypropylene	-AD	SB		●	■	●	■	●	■		■				
Rigid PVC	-AR	SE								■					

■ Standard Material ● Optional Material SB= Slow Burning SE= Self Extinguishing

ABS

A versatile engineering thermoplastic offering the best balance of properties of common rigid thermoplastic materials — good impact strength, good heat resistance, good low-temperature properties, excellent electrical properties, and fair-to-good chemical resistance. Plateable grades available.

ACETAL

An engineering thermoplastic that offers strength, rigidity, and good moisture, heat, and chemical resistance. Excellent abrasion resistance.

NYLON

Most common material for standard plastic fasteners. Structurally strong, nylon features low coefficient of friction, good insulating properties, resistance to heat (self-extinguishing), shock, vibration, and chemical solvents.

Light, elastic; has superior torque strength. Available glass filled or unfilled.

Material has temperature range of 40° to 250°F.

POLYCARBONATE

Most desirable balance of properties of any thermoplastic material available — excellent high and low temperature strength, good heat resistance (up to 250° F under load), high impact strength (in -275° to +250° F range), excellent dimensional stability, nontoxic, self-extinguishing, and excellent electrical insulation.

POLYETHYLENE

Low-cost, medium-strength material. Good insulator and has "rubber-like" characteristics. Can be used for

temperature applications up to 190° F.

POLYPROPYLENE

Lightest of the thermoplastics. Excellent chemical, heat, and electrical resistance properties. Is original "living" hinge material. Main disadvantage is low-temperature brittleness. Plateable grades available.

RIGID PVC (Polyvinyl Chloride)

Used for many special fastener applications. Exceptional resistance to acids, alkalis, and alcohols. Excellent in corrosive applications. Self extinguishing. Will not impart taste or color to materials

The dimensions of the above parts are envelope dimensions only. For complete design information, please request a blueprint from your Tinnerman representative or the Tinnerman Engineering department.

Metric parts listed in *italic*

Flat-Type Fasteners Rectangular

The **Flat-Type Speed Nut** is the basic design from which thousands of **Speed Nut Brand Fasteners** have been developed.

Flat-Type Speed Nut Fasteners are one-piece, self-locking, heat-treated, spring-steel fasteners that replace threaded nuts, lockwashers and spanner washers. On many applications, they eliminate time-consuming assembly operations. Fast and easy to apply, **Speed Nut Fasteners** provide maximum holding power at minimum cost per fastener. They never shake loose from vibration, yet can be easily loosened when desired, without worry about rust- frozen screw threads.

Hold **Speed Nut** in desired position with prongs pointing outward, toward fingers. Start screw through **Speed Nut** impression.

Press **Speed Nut** firmly against panel and drive screw. Finger pressure is sufficient to prevent **Speed Nut** turning as screw is driven.

The only variations available are those shown with suffix letters in the part number.
SS – Stainless Steel BE – Beryllium Copper P – Phosphor Bronze

Twin-Type Fasteners

Twin-Type Speed Nut Fasteners offer tremendous advantages over individual threaded nuts, lock and spanner washers on assemblies which have fastening locations in pairs. They are faster and easier to apply with only a single fastener to handle where four to six pieces are ordinarily required. Once the screws are started, the **Speed Nut** cannot turn, thereby eliminating the need for a wrench. This leaves both hands free to drive the screws into a properly locked position. Twin types are available in a wide range of screw sizes and center-to-center dimensions.

The **Twin-Type** is held in screw-receiving position and the screws are started by hand. No wrench is needed to hold the **Speed Nut** while the screws are driven tight. A center clearance hole is provided on some **Twin-Types** to allow the fastener to be riveted in screw-receiving position for blind location fastening.

Angle Bracket Fasteners

Angle Bracket Speed Nuts combine the conventional **Angle Bracket** with the **Speed Nut** Principle of Spring Tension Fastening to reduce the number of parts, speed assembly and provide structural strength. They are available in a wide variety of shapes and sizes and are applied in all industry from rugged construction to delicate electronics. Made from high quality heat-treated spring steel, they provide long life, reusability and resist vibration loosening, even under the severest conditions such as aircraft applications.

The assembly of **Angle Bracket Speed Nut** can be accomplished in several ways depending upon the nature of the assembly or the manufacturing facilities. They can be riveted, screwed, welded, latched, snapped or twist-locked into blind locations. They provide reliable fastening points at any desirable position on the panel, chassis, frame, bulk-head, etc.

Tinnerman® Single Thread Engaging Self-Retaining Fasteners

The dimensions of the above parts are envelope dimensions only. For complete design information, please request a blueprint from your Tinnerman representative or the Tinnerman Engineering department.

Metric parts listed in italic

J-Type Fasteners

Tinnerman **J-Type Speed Nut** fasteners press easily into self-retained position over panel edges or in center-panel locations. They are ideally suited for blind assembly or hard-to-reach installation. Offer floating alignment to speed production and lessen rejections.

No special tools, skills or equipment is required. Riveting, welding, clinching, staking and other secondary fastening devices are eliminated.

J-Type Speed Nuts can be applied after painting or porcelainizing panels eliminating the need for masking or retaping operations.

How to apply J-Type Fasteners

Start **J-Type Speed Nuts** over the edge of panel.

Push into position with thumb, snapping extrusion into hole. Short leg of **J-Type Speed Nuts** allows complete visibility of clearance hole while nut is being positioned.

Place second panel in position and drive the screw. Access to opposite side is unnecessary. Flush mounting can be attained by embossing either panel.

J-Type Speed Nuts can also be installed in center-panel locations through a rectangular hole as shown above. They are ideal for blind application and fastening.

U-Type Fasteners

U-Type Speed Nuts perform the same fastening functions as the J-Type, but are used where a full bearing surface on the lower leg is desired. They are self-retained in screw-receiving position to provide simple, rapid attachment of mating panels and cannot turn as the screw is driven.

Corrosion presents no problem, as the **Speed Nut** will not freeze on screw threads. In fact, the **Speed Nut** impression actually cleans out rust, dirt or paint clots from the screw threads as they are removed.

How to apply U-Type Fasteners

Start Tinnerman **U-Type Speed Nut** over the edge of panel.

Push into position until extrusion on lower leg snaps into screw hole. The **Speed Nut** "floats" in screw-receiving position to correct for normal misalignment in panel mounting holes.

Place second panel in position and drive the screw. Access to opposite side is unnecessary. Flush mounting can be made by embossing either panel.

U-Type Speed Nut can be installed in center of panel through a rectangular hole, permitting front-mounting attachments.

Tinnerman® Single Thread Engaging Self-Retaining Fasteners

The dimensions of the above parts are envelope dimensions only. For complete design information, please request a blueprint from your Tinnerman representative or the Tinnerman Engineering department.

Metric parts listed in italic

U-Type Wide Panel Range Fasteners

This innovative line of **Tinnerman® U-Nuts Fasteners** accommodates an unusually wide range of panel thicknesses from .025" to .150" which satisfies most needs for sheet metal and plastics assembly. A single **Wide Range U-Nut** can replace as many as 5 or 6 separate size nuts required to cover the same capacity. And, it can be supplied in **8AB** thru **14AB** thread sizes.

Engineering, purchasing and manufacturing all benefit from this unique concept. It provides a greater design flexibility and volume purchase economy. It reduces the separate number of parts to buy, stock, handle and inspect. It simplifies application and speeds assembly.

U-Type High Torque Fasteners

High-Torque Fasteners. Equally at home on metal or plastic, these unique Tinnerman fasteners bring extra strength, reliability and economy wherever vibration, impact, or migration prevail.

They accept power driven screws readily, discourage cross-threading, won't clog with paint or freeze to screw threads. They are self-retaining over a wide range of panel thicknesses, yet permit trouble-free removal. Unusually high clamp loads are attainable. Prevailing torque is inherent in the design.

Expansion-Type Fasteners

Expansion-Type Speed Nut Fasteners provide fast, vibration-resistant attachments in blind or center-panel locations where only one side is accessible. They snap easily into square or round holes and are self retained by spring legs. Special locking tabs are provided where permanent fastener retention is desired.

As the screw is driven, it expands the spring legs, locking them over the panel thickness and at the same time providing a double-locking action on the screw. These easy to apply fasteners require no special skills or equipment to install, can be used in place of weld-, clinch- or stake-type fasteners. Applied before or after painting, they will not clog — do not require masking. And, they can be safely applied after procelainizing.

How to apply Speed Clip Expansion-Type Fasteners

Special Expansion-Type Fasteners

Special Expansion-Type Tinnerman Fasteners

On this page are examples of **Expansion-Type Fasteners** which have been developed to solve specific fastening problems. The expansion principle is the same, but forms vary to: plug a temporarily unused hole, provide vibration-resisting adjustment, fasten in wood, heavy gauge metal or odd-shaped panel holes. They illustrate Tinnerman's ability to help the manufacturer fasten his product better, faster and at lower cost.

Perhaps one of these **"Specials"** will suit or suggest an answer to your particular fastening problems.

Tinnerman® Multiple Thread Engaging Nut and Bolt Retainers

The dimensions of the above parts are envelope dimensions only. For complete design information, please request a blueprint from your Tinnerman representative or the Tinnerman Engineering department.

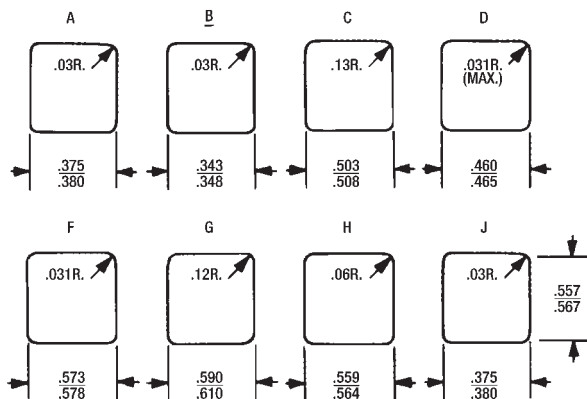

Metric parts listed in italic

Nut Retainers

Tinnerman **Nut Retainers** combine the best advantages of spring steel fasteners with the high strength of a multi-threaded nut. They snap readily into bolt-receiving position at panel edges or center-panel locations and retain themselves in place.

Their application does not require special tools or skills, eliminating the need for special operations. They can be applied at any convenient spot along the assembly line after painting or porcelainizing, thus eliminating the need for masking or retapping clogged threads. The nut floats within the spring steel cage more than enough to offset normal hole misalignment. No other line of heavy duty fasteners offers so many advantages for blind location assembly.

Nut Retainers (Continued)

How to apply Nut Retainers

1. One retaining leg of the **Nut Retainer** is inserted in the panel hole. The other leg is snapped in place with a simple tool.
2. The second panel is then aligned and the bolt is started into the threads of the captive nut.
3. The **Nut Retainer**, being self-retained in a square hole, cannot turn as the bolt is tightened. Positive, high torque attachment is the result.

Screw Size	Part Number
10-32	D31758-1032
M5X.8	D31758-M508

Self-Anchoring Nut Retainers

Tinnerman **Self-Anchoring Nut Retainers** offer the same advantages as the preceding **Nut Retainers**; i.e., high strength, easy to apply for blind fastening locations, self-retention, etc. In addition, this variety provides a unique feature which firmly locks the fastener in the panel, distributing the driving torque through the surrounding panel area. This is accomplished with a T-shaped captive nut, cleverly devised locking tabs, and mounting legs. It cannot be accidentally dislodged even with excessively rough handling. However, should thread damage occur due to cross-threading or over torquing, it can be deliberately removed without damage to panel or finish. **Self-Anchoring Nut Retainers** are recommended for applications where fasteners with less permanent retention are apt to be lost due to stacking, butting or rough handling of panels on the production line.

How to apply Self-Anchoring Nut Retainers

Self-Anchoring Nut Retainers are set into the panel mounting hole after the finishing process. The spring steel mounting legs temporarily hold the fastener in place as the T-nut is pressed into locked position in the panel. As the T-nut expands the mounting legs around the panel, it forces past spring tabs provided in the retainer which snap back locking the fastener firmly, permanently in the panel.

Tinnerman® Multiple Thread Engaging Nut and Bolt Retainers

The dimensions of the above parts are envelope dimensions only. For complete design information, please request a blueprint from your Tinnerman representative or the Tinnerman Engineering department.

Metric parts listed in italic

J-Type Nut Retainers

The **J-Type Nut Retainer** combines a spring steel retainer with a multiple-threaded nut to provide an ideal fastener for heavy duty applications requiring high torque tightening, low fastener profile, "float" for hole misalignment and blind assembly. They are easily snapped over panel edges or inserted into rectangular holes in central-panel locations. Floating alignment and retention are attained with extrusions in the retaining legs which snap into panel mounting holes allowing the fastener to shift or align, but not disengage. Applied after painting or porcelainizing, **J-Type Nut Retainers** eliminate the need for masking or retapping clogged threads.

How to apply J-Type Nut Retainers

Push into place on panel, snapping the extrusion into the mounting hole. Short retaining leg of **J-Type Nut Retainers** allows complete visibility of mounting hole while nut retainer is being attached. Access to back of panel is unnecessary in final assembly stage.

Position second panel and drive screw. Both hands are free to align panels or components and complete assembly. Flush mounting is obtained by embossing either panel.

J-Type Nut Retainers can be installed in center panel locations through a rectangular hole as illustrated here.

SS – Stainless Steel BE – Beryllium Copper P – Phosphor Bronze

U-Type Nut Retainers

U-Type Nut Retainers offer the same advantages as the **J-Type Nut Retainers**. That is, heavy-duty fastening, low fastener profile, "float" for hole misalignment, self-retention and blind location fastening. With the full-sized lower leg, the **U-Type Nut Retainer** is preferred where a full bearing surface between the panels is desired. They are applied simply and quickly in center, or end-panel locations requiring no special skills or equipment.

How to apply U-Type Nut Retainers

Position the second panel and drive the screw. Both hands are free to align panels and complete the assembly. Flush mounting is attained by embossing either panel.

Push into bolt receiving position on panel until extrusion snaps into mounting hole. Access to the back of the panel is unnecessary as the nut retainer is self-retaining and the nut is trapped to prevent turning.

U-Type Nut Retainers can be installed in center-panel locations through a rectangular hole as illustrated here. They offer an ideal solution for blind fastening.

Tinnerman® Multiple Thread Engaging Nut and Bolt Retainers

The dimensions of the above parts are envelope dimensions only. For complete design information, please request a blueprint from your Tinnerman representative or the Tinnerman Engineering department.

Metric parts listed in italic

Bolt Retainers Rear Mounting Type

Tinnerman **Bolt Retainers** eliminate problems of blind location, bolt retention, threaded stud damage, paint-clogged threads, weld flash and difficult assembly or removability wherever threaded studs may be used. They can be attached after finishing and just before final assembly to eliminate thread damage due to stacking, weld flash, paint clogging, etc. One type is mounted from the front to ease assembly in blind or difficult locations. Both are self-retained and can be easily removed and replaced without damage to the mounting panel. Access to the underside of the panel is unnecessary because the bolt cannot turn as the nut is driven to its prescribed torque. A shallow emboss allows flush mounting of mating panels.

How to apply Bolt Retainers

Hold the threaded bolt between the thumb and forefinger. Tip the retainer into the mounting hole allowing the wing-like spring legs to rest on the panel. Apply a rearward pressure on the top panel side of the bolt until the embossed shear snaps into the panel hole locking the **Bolt Retainer** in position.

Push-on-Type Fasteners (Round Studs)

Tinnerman **Push-On-Type Fasteners** provide lightning-fast attachments to plain unthreaded studs such as rivets, die cast studs, tubing, nails, rods, etc. They make a positive “bite” on metal, plastic or wood and grip securely even on very smooth, hard surfaces. No threaded devices of any kind are necessary; therefore, the rate of assembly can be greatly increased through their use. Attachments can be made permanent or removable, as the product requires, by simply using the proper fastener or stud modification recommended. Made of quality high carbon spring steel, heat treated, they assure long, dependable service life at a minimum of assembly cost.

How to apply Push-on-Type Speed Nut Fasteners

Stud engaging **Speed Nut** brand fasteners are used in two ways. Either as free parts which are pressed over shaft, stud or rod ends; or captive parts which are retained on a panel in stud-receiving position. Whether the fastener is applied to the work or the work is applied to the fastener, the method is simply to position the two in square alignment and zip into locked position.

The dimensions of the above parts are envelope dimensions only. For complete design information, please request a blueprint from your Tinnerman representative or the Tinnerman Engineering department.

Metric parts listed in italic

Grooveless Retainer Rings

Superior stainless steel fasteners. Provide 360° of bearing surface for maximum holding power...without a groove!

Tinnerman **Grooveless Retainer Rings** press over studs, shafts, or any round shape from .046" to 2.00" diameter. **G-R-R's** become an integral part of the axial application, replacing snap or bearing rings, cotter pins, staking, swaging, spinning, heat forming, ultrasonics, coining, cementing, or upsetting... eliminating high-cost operations.

Designed without slots, or shears, **G-R-R's** will not "walk-off" or spring free. Low profile flat designs require a minimum of space. Wall dimensions as thin as .024" make them ideal for limited access locations. They need as little as .032" of shaft or stud extension for full anchor.

Quality stainless steel assures long life, corrosion resistance, minimal distortion, dry finish, eliminates heat treat, finish and handling operations...and the extra costs they entail.

A full range of sizes has been developed on modular tooling. Virtually any unlisted size can be made that falls within the limits of the tools, for a one-time set up charge. Sizes beyond this range can be made but require special tooling.

*Patented

Tubular-Type Fasteners

Tubular-Type Speed Clips team up with unthreaded studs or rivets to virtually “nail” assemblies together. Hand-snapped into punched or molded holes in metal, plastic or wood, they retain themselves in stud-receiving position. The mating panel is positioned with mounting studs properly aligned and pressed home to complete the assembly. **Tubular-Type Speed Clips** are ideal for making fast, practical attachments where only one side of an assembly is accessible ... perfect for attaching name plates, instruction plates, grille work and decorative trim, knobs, insulation dust shields and other lightweight equipment.

How to apply Tubular-Type Speed Clip Fasteners

Insert the **Speed Clip** into the panel hole causing spring arms to compress. When fully seated, the spring arms snap out behind the panel to hold the clip in position.

Line up the mating panel and start rivet or stud into **Speed Clip**.

Seat rivet, causing it to engage turned-in end of **Speed Clip**, locking assembly. A rounded stud end is recommended for greater ease of assembly.

Ball-Stud Fasteners

Ball-Stud Speed Clips were originally developed as spring catch fasteners on aircraft access doors, inspection panels, sealing strips and other similar assemblies requiring repeated disengagement. Their versatility soon found them used extensively in other fields where they secured kitchen cabinet doors, removable toe plates, electronic cabinets, protective covers, etc. There is no direct contact between the stud and panel surfaces. This eliminates wear or chipping of painted or porcelainized surfaces and resulting corrosion. When latched, the spring legs of the **Speed Clip** continually bear inward on the spherical or serrated studs, holding the latched unit snug against the panel.

Where adjustability or wide latching ranges are required, the serrated stud is used. They are mainly used for attaching compressionable materials such as rubber, fabric, insulation, etc.

Pull-out tensions, depending on the material thickness of the **Speed Clip** and the stud used, can be provided from 3.5 pounds to 50-65 pounds. Various panel thicknesses are accommodated by varying the stud lengths.

How to apply Ball-Stud Speed Clip Fasteners

The **Speed Clip** is riveted in position on the panel with either plain or 100 degree counter-sunk head rivets.

The **Ball-Stud** is riveted, bolted or screwed into the mating panel.

The panels are snapped together. Owing to the resiliency of the spring legs, misalignment resulting from a normal amount of manufacturing tolerances can be readily absorbed.

Dart-Type Fasteners

Tinnerman **Dart-Type Fasteners** are one of a group of **Speed Clip Fasteners** which are self-sufficient. That is, they require no screws, rivets, studs, welds or other secondary fastening devices. They require only a cavity or mounting hole. They can be applied from the front or top of a panel thereby eliminating many blind or limited access fastening problems. Being one-piece, they eliminate excessive small parts handling and parts inventories.

Once applied, live spring tension secures the components between the top and shoulders of the clip. The amount of clamping action here varies with the material thickness and design of the fastener. When required, most **Dart-Type Speed Clips** can be removed and reused.

How to apply Dart-Type Speed Clip Fasteners

Position **Dart-Type** in mounting hole of panels or components to be secured.

As the clip is pushed into the mounting hole, spring arms compress.

As the shoulders clear the panels they expand. This constant attempt to regain its original shape develops live spring tension between the shoulders and the top of the clip – securing the panels between.

Metric parts listed in italic

Trim Clip Fasteners

Trim Clip Fasteners recently introduced, these unique Tinnerman fasteners have real potential as a general purpose fastener.

Designed for use over rectangular studs or integrally molded blades, ribs, etc., on trim strips, access plates, or any light application where removability is a factor.

How to apply Trim Clip Fasteners

The **Trim Clip** is simply pressed over the stud, blade, rib, etc., with the barbed, u-shaped retaining legs fully seated. Then, as part of the strip or plate assembly, is pressed into assembled position on the panel, frame, door, appliance, or whatever.

Rectangular mounting holes or gaps between panel or frame members serve as anchor points for the clip. The self-equalizing retaining legs are formed into a dart-type configuration for easy mounting. They assure a snug, rattle free installation, yet will yield to deliberate removal force applied to the trim or plate.

Knob-to-Shaft Fasteners (Compression Rings)

Self-retaining Tinnerman **Speed Clips** solve a host of **Knob-to-Shaft** assembly problems. They eliminate inserts and setscrews for reduced molding costs and easier, faster assembly. Stresses are distributed evenly around the hub during application while the strength and durability of spring steel reinforces critical wearing points and harnesses cold-flow tendencies. Knobs can be removed and replaced repeatedly without danger of loosening or developing “knob-wobble”.

Two basic designs are available for standard applications. **Compression Rings** are for use on thermoplastic knobs with split hubs. They squeeze the hub around the shaft insuring firm, reliable retention. **Round, D-shaped or Knurled Shafts** can be used depending upon the hub cavity design. **“C” Clips** are recommended for die cast or thick-walled thermosetting plastic knobs. For use with D-shaped shafts only, they bear against the flat side of the shaft clamping it firmly within the hub cavity.

Where knob designs do not permit the use of either **Compression Rings** or **“C” Clips**, **Speed Clips** are available, or can be designed to fit within the knob cavity. Several variations are illustrated at the end of this section.

How to apply Knob-to-Shaft Speed Clip Fasteners

A simple tool picks up and expands the **Compression Ring**. The end of the tool is placed over the knob hub and the ring is transferred from the tool to the outer circumference of the hub in one easy motion. **“C” Clips** can be assembled over the hub with a similar tool or lightly rapped in place with a mallet. Data on these simple assembly tools is available on request.

Metric parts listed in italic

U-Type Fasteners (Standard)

Tinnerman **U-Type Speed Clip Fasteners** snap easily over metal, plastic or wooden panels providing a strong clamping action for firm, vibration-free assembly. They are self-sufficient requiring no holes, screws, welds, rivets or other secondary fastening devices. They are low cost, removable and reusable requiring only the simplest assembly procedure. Turned-up lead lips on one or both legs allow fast assembly over the panel edges. Some are equipped with barbs for positive retention of the panel.

Depending upon design, they can be used to clamp or hinge panels together, provide a removable spring catch, apply delicate spring tension on fragile surfaces, secure light components within cavities, etc. Fastening applications for these heat-treated, spring steel **Speed Clips** are limited only by the imagination.

How to apply U-Type Speed Clip Fasteners

Align panels to be secured and lead **U Clip** over the edges at a slight angle. Once both legs are started over the panel, simply press until fully seated.

Material: All parts are **Spring Steel**, heat treated, unless otherwise specified.
The only variations available are those shown with suffix letters in the part number.
SS – Stainless Steel BE – Beryllium Copper P – Phosphor Bronze

S-Clip Fasteners

Tinnerman **S-Clip Fasteners** are used for attaching panels with a spring cushion fastening that prevents chipping or crazing from expansion or stains in handling of shipment. Eliminate holes in panels or flanges.

Design Variations

Parts shown as **Standard** or with **Design Variations** are available only in that particular design.

Cable, Wire, Rod & Tube Clips

Tinnerman **Clips** offer the most efficient means of securing cable, wire and tubing safely away from danger areas. Made of high carbon **Spring Steel**, heat-treated, they are one-piece and self-retaining in most cases, requiring only a mounting hole, flange end or panel edge for fast easy installation. Available in several standard designs for a wide range of line diameters and panel thicknesses, many have rolled edges as an added safeguard against fraying or chafing. They can also be supplied with a dipped neoprene, cushion.

Though quick and simple to install, they provide positive retention for reliable, trouble-free service.

Cable, Wire, Rod & Tube Clips (continued)

How to apply Cable-Type Clips

Clips provided with a self-retaining "heel and toe" impression are simply positioned in the mounting hole as shown above. Pressure at the back of the **Clip** forces it forward until the "heel" snaps into locked position. The cable, wire, etc. is then installed for final assembly.

To remove "heel and toe" **Clips** simply raise the fastener with a simple tool to release the "heel" and press rearward to disengage the toe. These fasteners can be re-used indefinitely.

Types with "U" shaped retaining legs are pressed over panel or flange ends and lock firmly in place.

Finish Variation

Where desired these **Speed Clips** can be furnished with a dipped neoprene cushion. To specify neoprene use -16 as the finish dash number.

Example: C20635-020-16

Tube, Harness & Hose Clamps

Tinnerman **Tube Clamps** for mounting tube, conduit, cable, wire or other cylindrically shaped objects are available for a wide range of diameters. Standard sizes range from .062" to 2.000" diameters. Larger sizes are available on special order. Made of top quality materials, Tinnerman **Tube-Type Clamps** provide strong, reliable retention and assure dimensional stability.

Available with dipped or extruded flame-resistant neoprene cushion to protect against abrasion or chafing, they can also be supplied with a self-retaining **Speed Nut Fastener** on one leg for easier, vibration-resistant installations. This feature offers a tremendous advantage in close quarters where loose or separate parts, such as nuts and lockwashers, create excessive small parts handling and unnecessary delays.

Special designs can be developed to meet special requirements. Many examples of such are shown here and on the following pages.

How to apply Tube-Type Clamps

The standard **Tube-Type Clamp** is formed to allow application over its prescribed tube diameter at any desired location without undue distortion. Once positioned on the tube, the screw is driven and the clamp legs draw together for a tight assembly. The **Speed Nut Fastener** shown in place on this clamp reduces parts handling and accelerates assembly. Tinnerman **Tube-Type Clamps** are available with or without the fastener in place.

Cap Type Push-On Plastic Fasteners

Tinnerman® **Plastic Cap Nuts** combine the good looks and durability of high density linear polyethylene with the reliability of high carbon spring steel. Used over shaft, stud or rod ends for a multitude of uses they will enhance any product by adding color while providing dependable, vibration resistant assembly. Available in eight attractive standard colors, they may also be color matched in quantity orders. Wherever decorator colors are needed, colorful Tinnerman **Plastic Caps** can add substantially to a product sales appeal.

How to apply Cap Type Push-On Plastic Fasteners

Simply zipped down the axle, shaft or stud, the Tinnerman® spring steel insert bites hard for positive retention. Properly applied, the **Cap Nut** will never loosen and fall off.

Available Colors

Plastic Cap Fasteners are available in eight standard colors:

Natural	(-801)	Black	(-805)
White	(-802)	Silver	(-806)
Red	(-803)	Yellow	(-807)
Blue	(-804)	Green	(-808)

When ordering, add the dash number shown next to color selected, to the part number.
Example: C60002-125-801 (natural)

Material: Nylon (AA)

Finish: Natural

Expansion Type Plastic Fasteners

Tinnerman® **Expansion Nuts** are rugged little nylon fasteners with big advantages. Ideal for front mounted attachments, they are self-retained and fast and easy to apply. Used with No. 8 or No. 10 sheet metal screws, they resist up to 200 pounds pull. Completely enclosed in plastic, the screw threads are protected from corrosion or galvanic action. This also eliminates the danger of wire chafing or scratching on sharp screw cutting edges. Being nylon, **Expansion Nuts** offer excellent insulating qualities, both electrical and thermal.

Standard **Expansion Nuts** are available with spacer head heights from .031" to .600" and a panel range of .020" to .076". Design variations available for round and square head types include plastisol seals, oversized head dimensions, greater panel range, etc.

How to apply Expansion Type Plastic Fasteners

Simply pressed into the panel from the front side, the **Expansion Nut** is self-retained in screw receiving position. During assembly the driven screw expands the fastener behind the panel to which it is mounted, locking it in place and sealing the hole against moisture and dirt.

Toggle Type Plastic Fasteners

Tinnerman® nylon **Toggle Nuts** offer many assembly advantages that lead to important manufacturing cost savings. They are simple and fast to apply, provide thermal and electrical insulation, are shock and vibration resistant, and provide high shear and tensile strength.

Standard "**Toggles**" have a generous panel range of .020" to .110" and offer a selection of integral spacer head heights up to 2.00" in 1/16" increments. They are corrosion proof, withstand a wide temperature range (-40° to 250°F) and have excellent dielectric properties. The mounting screw is enclosed in nylon to protect against wire chafing, scratching or galvanic action.

Variations on the standard design have been developed to meet specific needs. Some of these include special sealers, electrical connectors, oversized heads, extra panel range, extra torque values, etc.

E Head Height	Head Type	Des. Var.	B1	B2	G Sq. Mnt. Hole	Part Number
.031	Square	Std.	.305	.250	.250-.281	C60053AA-031
	Square	F	.290	.265	.265-.281	C61278AA-031
.062	Square	Std.	.305	.250	.250-.281	C60053AA-062
.100	Square	F	.290	.265	.265-.281	C61278AA-100
.250	Round	E	.305	.250	.250-.281	C61374AA-250

How to apply Toggle Type Plastic Fasteners

The "**Toggle**" snaps easily into place from the front side and is self-retained—ideal for blind attachments. As the screw is driven, the body of the fastener is drawn toward the head expanding flexible sides against the back side of the panel. Adjacent tabs are forced outward simultaneously to help seal the mounting hole against dust and moisture.

Clinch Type Plastic Fasteners

Tinnerman® **Clinch Type** Fasteners offer a host of assembly advantages. They are front-mounted, fast acting, and easy to apply. No special tools are required. Easily removed, yet may be reused without loss of holding power. Available in three sizes: for 1/8", 3/16", and 1/4" diameter mounting holes over a wide range of panel thicknesses. The **Clinch Type** fastener consists of a one-piece molding with two elements, a "T" shaped drive pin and a U-shaped expander which are joined by thin break-away web sections. The head is smooth with a low profile to give an attractive finished appearance, and they are available in natural or black nylon.

Clinch Type Plastic Fasteners

How to apply Clinch Type Plastic Fasteners

1. The "U" portion is inserted through the mounting hole. Tabs on sides of "U" provide self-retention to panels until seated.
2. The "T" shaped drive pin is then rapped lightly to bottom, expanding the sides of the "U" behind panels to lock securely in place.

Wire and Tube Retainers Plastic Fasteners

How to apply Polyclamp Fasteners

The "expander" is simply snapped into a 1/4" diameter panel hole from the front side. Retaining tab permits preassembly in any position.

The strap wraps around the wire bundle, etc. and the lock pin presses to bottom as shown. Entry enlarges the expander behind the panel for firm, positive retention.

Design Variations

Parts shown as **Standard** or with **Design Variations** are available only in that particular design.

Button Head Dart Fasteners

Button Head Dart Fasteners. These versatile plastic fasteners offer many diversified application possibilities. They may be used for light retention, as bumpers, hole plugs, bearings or spacers. Ideally suited for simplified assembly of products shipped knocked-down for consumer assembly. Available in different materials, head types and panel ranges.

In addition to the inherent advantage of being corrosion-proof, **Button Head Darts** are shock and vibration resistant, and will not work loose.

How to apply Button Head Dart Fasteners

Position **Button Head** in mounting hole of panels or components to be secured.

The tapered **Dart** guides panels into alignment as it is seated, leaving only the smooth **Button Head** exposed.
